Chapter 1

The TRDP Light Library API Specification

1.1 General Information

1.1.1 Purpose

The TRDP protocol has been defined as the standard communication protocol in IP-enabled trains. It allows communication via process data (periodically transmitted data using UDP/IP) and message data (client - server messaging using UDP/IP or TCP/IP) This document describes the light API of the TRDP Library.

1.1.2 Scope

The intended audience of this document is the developers and project members of the TRDP project. TRDP Client Applications are programs using the TRDP protocol library to access the services of TRDP. Programmers developing such applications are the main target audience for this documentation.

1.1.4 Abbreviations and Definitions

-*API* Application Programming Interface

-*ECN* Ethernet Consist Network

-*TRDP* Train Real-time Data Protocol

-*TCMS* Train Control Management System

1.2 Terminology

The API documented here is mainly concerned with three bodies of code:

- *TRDP Client Applications* (or 'client applications' for short): These are programs using the API to access the services of TRDP. Programmers developing such applications are the main target audience for this documentation.

- *TRDP Light Implementations* (or just 'TRDP implementation'): These are libraries realising the API as documented here. Programmers developing such implementations will find useful definitions about syntax and semantics of the API wihtin this documentation.

- *VOS Subsystem* (Virtual Operating System): An OS and hardware abstraction layer which offers memory, networking, threading, queues and debug functions. The VOS API is documented here.

The following diagram shows how these pieces of software are interrelated.

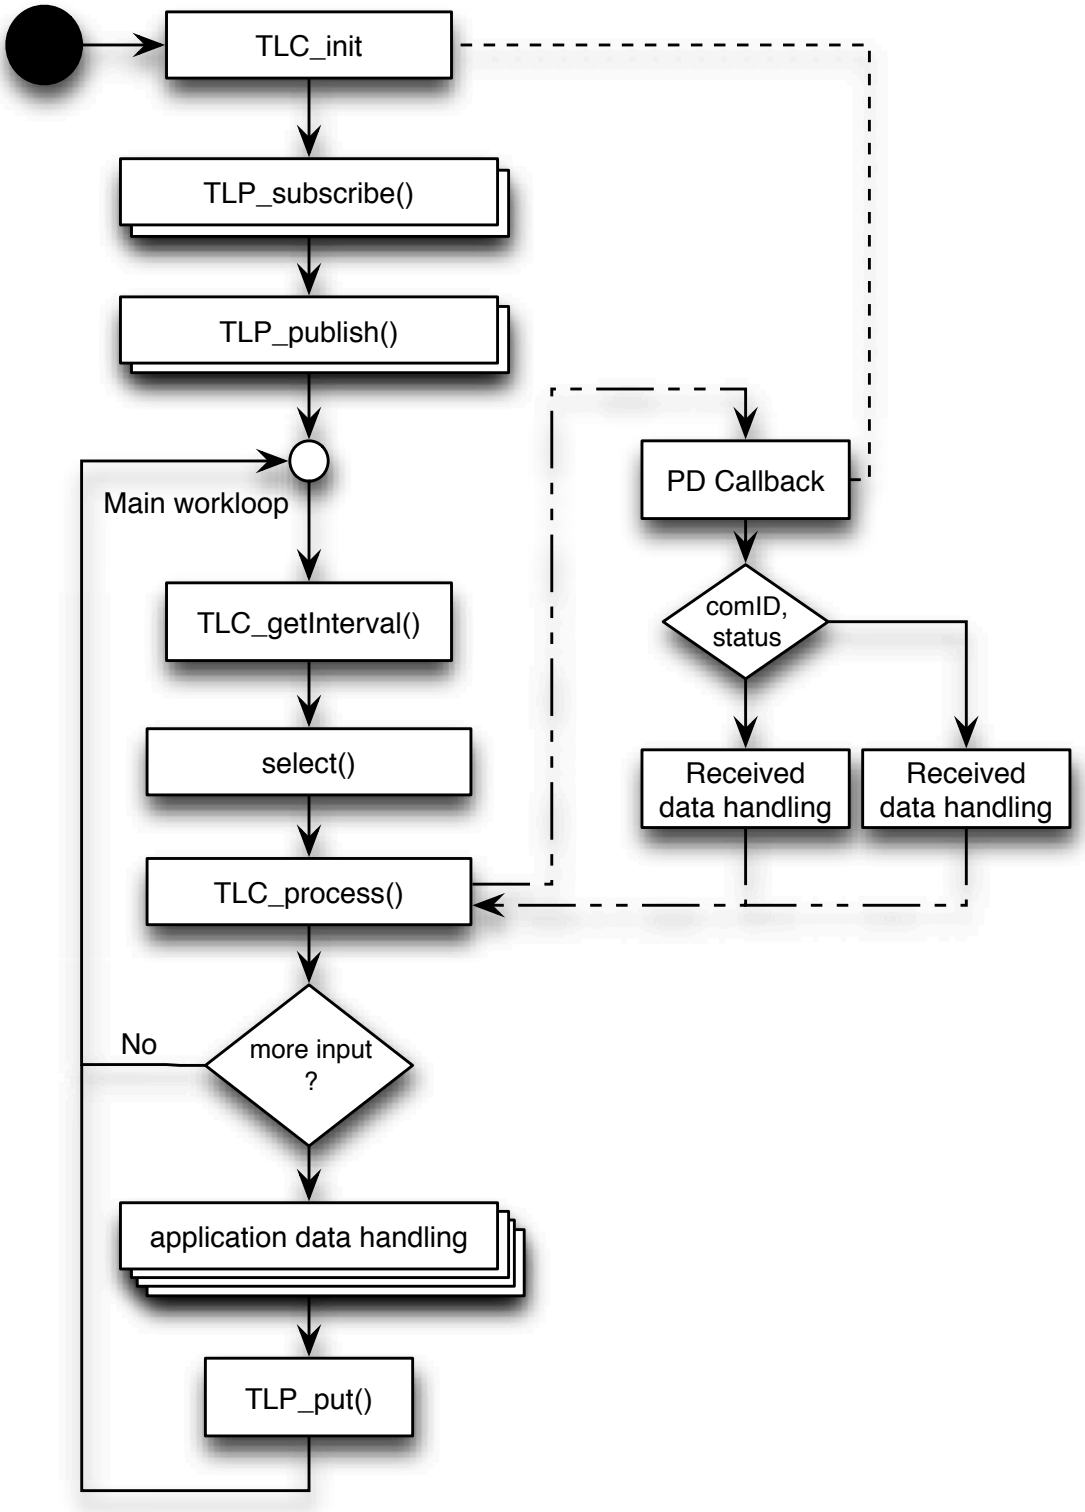

Figure 1.1: Sample client workflow

1.3 Conventions of the API

The API comprises a set of C header files that can also be used from client applications written in C++. These header files are contained in a directory named `trdp/api` and a subdirectory called `trdp/vos/api` with declarations not topical to TRDP but needed by the stack. Client applications shall include these header files like:

```
#include "trdp_if_light.h"
```

and, if VOS functions are needed, also the corresponding headers:

```
#include "vos_thread.h"
```

for example.

The subdirectory `trdp/doc` contains files needed for the API documentation.

Generally client application source code including API headers will only compile if the parent directory of the `trdp` directory is part of the include path of the used compiler. No other subdirectories of the API should be added to the compiler's include path.

The client API doesn't support a "catch-all" header file that includes all declarations in one step; rather the client application has to include individual headers for each feature set it wants to use.

5.25.2 Function Documentation

5.25.2.1 TRDP_ERR_T trdp_pdCheck (PD_HEADER_T * *pPacket*, UINT32 *packetSize*)

Check if the PD header values and the CRCs are sane.

Parameters:

← ***pPacket*** pointer to the packet to check

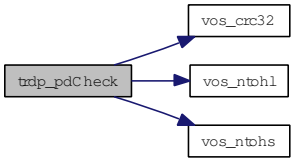
← ***packetSize*** max size to check

Return values:

TRDP_NO_ERR

TRDP_CRC_ERR

Here is the call graph for this function:



5.25.2.2 void trdp_pdDataUpdate (PD_ELE_T * *pPacket*)

Add padding and update data CRC.

Here is the call graph for this function:

5.25.2.3 TRDP_ERR_T trdp_pdDistribute (PD_ELE_T * *pSndQueue*)

Distribute send time of PD packets over time.

The duration of PD packets on a 100MBit/s network ranges from 3us to 150us max. Because a cyclic thread scheduling below 5ms would put a too heavy load on the system, and PD packets cannot get larger than 1436 (+ UDP header), we will not account for differences in packet size. Another factor is the differences in intervals for different packets: We should only change the starting times of the packets within 1/2 the interval time. Otherwise a late addition of packets could lead to timeouts of already queued packets. Scheduling will be computed based on the smallest interval time.

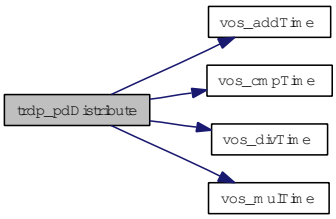
Parameters:

← ***pSndQueue*** pointer to send queue

Return values:

TRDP_NO_ERR

Here is the call graph for this function:



5.25.2.4 void trdp_pdInit (PD_ELE_T * *pPacket*, TRDP_MSG_T *type*, UINT32 *topoCount*, UINT32 *replyComId*, UINT32 *replyIpAddress*)

Parameters:

← ***appHandle*** session pointer

5.26.2 Function Documentation

5.26.2.1 TRDP_ERR_T trdp_pdCheck (PD_HEADER_T * *pPacket*, UINT32 *packetSize*)

Check if the PD header values and the CRCs are sane.

Parameters:

← ***pPacket*** pointer to the packet to check

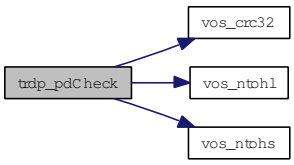
← ***packetSize*** max size to check

Return values:

TRDP_NO_ERR

TRDP_CRC_ERR

Here is the call graph for this function:



5.26.2.2 void trdp_pdDataUpdate (PD_ELE_T * *pPacket*)

Add padding and update data CRC.

Here is the call graph for this function:

5.26.2.3 TRDP_ERR_T trdp_pdDistribute (PD_ELE_T * *pSndQueue*)

Distribute send time of PD packets over time.

The duration of PD packets on a 100MBit/s network ranges from 3us to 150us max. Because a cyclic thread scheduling below 5ms would put a too heavy load on the system, and PD packets cannot get larger than 1436 (+ UDP header), we will not account for differences in packet size. Another factor is the differences in intervals for different packets: We should only change the starting times of the packets within 1/2 the interval time. Otherwise a late addition of packets could lead to timeouts of already queued packets. Scheduling will be computed based on the smallest interval time.

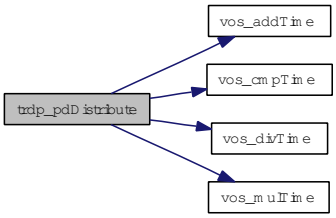
Parameters:

← ***pSndQueue*** pointer to send queue

Return values:

TRDP_NO_ERR

Here is the call graph for this function:



5.26.2.4 void trdp_pdInit (PD_ELE_T * *pPacket*, TRDP_MSG_T *type*, UINT32 *topoCount*, UINT32 *replyComId*, UINT32 *replyIpAddress*)

Initialize/construct the packet Set the header infos.

Parameters:

← ***pPacket*** pointer to the packet element to init

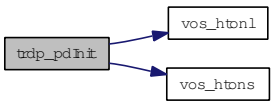
← ***type*** type the packet

← ***topoCount*** topocount to use for PD frame

← ***replyComId*** Pull request comId

← ***replyIpAddress*** Pull request Ip

Here is the call graph for this function:



5.26.2.5 TRDP_ERR_T trdp_pdReceive (TRDP_SESSION_PT *appHandle*, INT32 *sock*)

Receiving PD messages Read the receive socket for arriving PDs, copy the packet to a new PD_ELE_T Check for protocol errors and compare the received data to the data in our receive queue.

If it is a new packet, check if it is a PD Request (PULL). If it is an update, exchange the existing entry with the new one Call user's callback if needed

Parameters:

← ***appHandle*** session pointer

← ***sock*** the socket to read from

Return values:

TRDP_NO_ERR no error

TRDP_PARAM_ERR parameter error

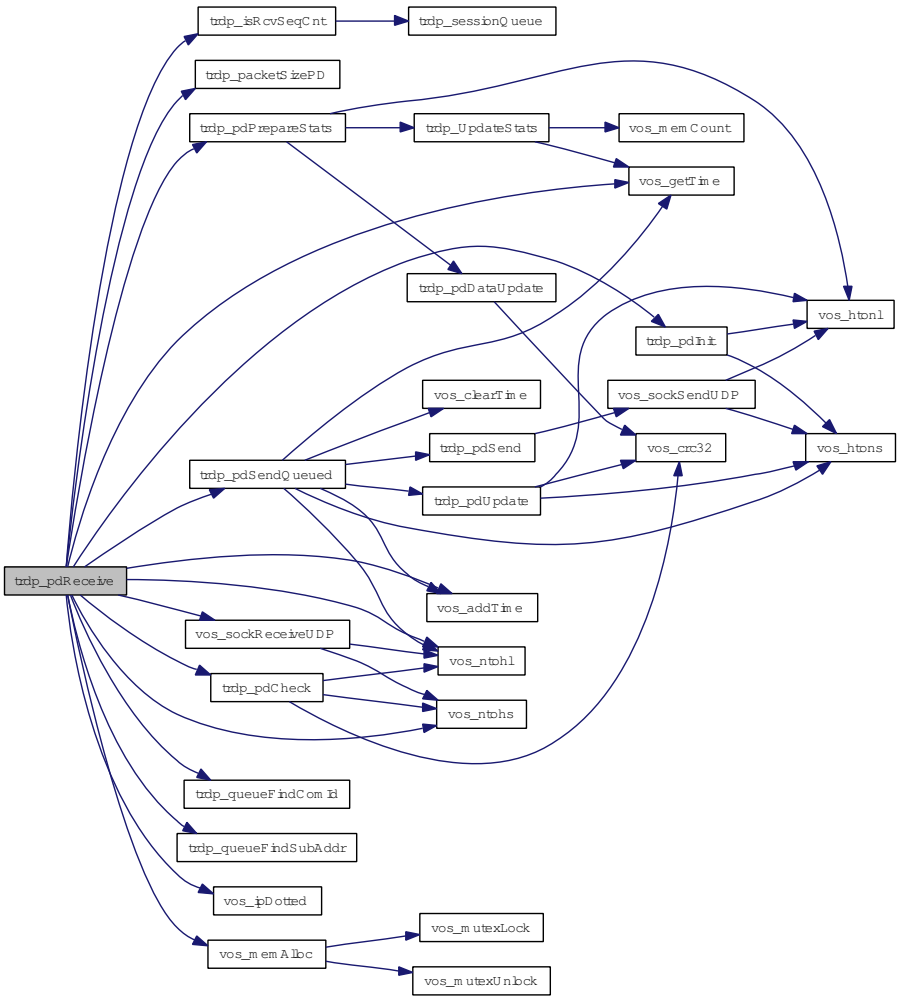
TRDP_WIRE_ERR protocol error (late packet, version mismatch)

TRDP_QUEUE_ERR not in queue

TRDP_CRC_ERR header checksum

TRDP_TOPOCOUNT_ERR invalid topocount

Here is the call graph for this function:



5.26.2.6 TRDP_ERR_T trdp_pdSend (INT32 *pdSock*, PD_ELE_T * *pPacket*, UINT16 *port*)

Send one PD packet.

Parameters:

← ***pdSock*** socket descriptor

← ***pPacket*** pointer to packet to be sent

← ***port*** port on which to send

Return values:

TRDP_NO_ERR

TRDP_IO_ERR

Here is the call graph for this function:

5.26.2.7 TRDP_ERR_T trdp_pdSendQueued (TRDP_SESSION_PT *appHandle*)

Send all due PD messages.

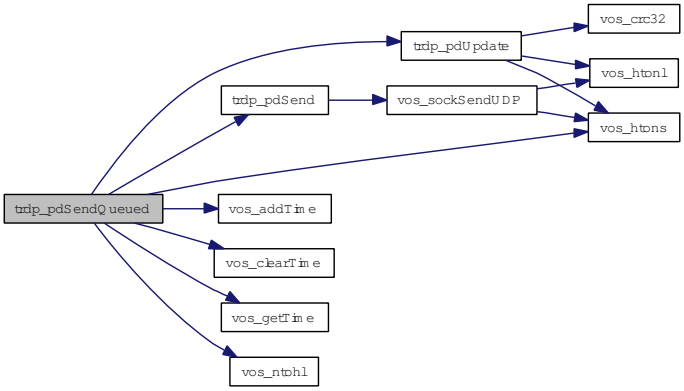
Parameters:

← ***appHandle*** session pointer

Return values:

TRDP_NO_ERR no error
TRDP_IO_ERR socket I/O error

Here is the call graph for this function:



5.26.2.8 void trdp_pdUpdate (PD_ELE_T * *pPacket*)

Update the header values.

Parameters:

← ***pPacket*** pointer to the packet to update

Here is the call graph for this function:

5.35.2 Define Documentation

5.35.2.1 #define VOS_MEM_BLOCKSIZES

Value:

```
{32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, \
                            16384, 32768, 65536, 131072, 262144, 524288}
```

We internally allocate memory always by these block sizes.

The largest available block is 524288 Bytes, provided the overal size of the used memory allocation area is larger.

Default pre-allocation of free memory blocks.

To avoid problems with too many small blocks and no large one. Specify how many of each block size that should be pre-allocated (and freed!) to pre-segment the memory area.
